“Digital Transformation in Accounting and Auditing –
The Benefits and Challenges of Adopting Digital Technologies”

The adoption and implementation of emerging technologies may help organizations and institutions to digitally transform their business processes. Digital transformation, however, is not simply using digital technologies. It is beyond technological usage. It involves change management, process re-engineering, and technological entanglement with people and processes. People, processes, and digital technologies can be modified and then reassembled in different ways in the digital transformation journey. The book aims to provide multidisciplinary and cutting-edge studies and opinions on the role of emerging technologies to help organizations digitally transform their accounting and auditing processes from both the perspectives of academia and professionals.

Topics of interest include, but are not limited to:

- **Determinants and consequences of digital transformation**, such as drivers, barriers, opportunities, and challenges of digital transformation, digital transformation ecosystems and the governance of digital transformation.
- **Technology aspects of digital transformation**, such as big data analytics (including social media and text analytics), internet of things, cognitive automation, blockchain, cryptocurrencies, and business process architecture.
- **Human aspects of digital transformation**, such as leadership, strategy and change in organizational cultures.
- **Legal and ethical aspects of digital transformation**, such as AI ethics, digital divide, digital discrimination, and legal issues.
- **Practitioners’ perspectives** of any of the four topics mentioned above or additional thoughts that fit into the scope of this book.

Important Dates

Submission due: August 31, 2022 (early submissions are encouraged)

Expected publication date: Summer 2023

Publisher

Palgrave Macmillan
